Question Number	Scheme	Marks			
1.					
	$x(1-4x^2)$ Accept $x(-4x^2+1)$ or $-x(4x^2-1)$ or $-x(-1+4x^2)$ or even $4x(\frac{1}{4}-x^2)$ or equivalent	B1			
	Factorises quadratic (or initial cubic) into two brackets	M1			
	x(1-2x)(1+2x) or $-x(2x-1)(2x+1)$ or $x(2x-1)(-2$	A1			
		[3]			
		[0]			
		3 marks			
	Notes				
	B1 : Takes out a factor of x or $-x$ or even $4x$. This line may be implied by correct final answer, but	if this stage			
	is shown it must be correct . So B0 for $x(1 + 4x^2)$				
	M1: Factorises the quadratic resulting from their first factorisation using usual rules (see note 1 in	n General			
	Principles). e.g. x (1 – 4x) (x – 1). Also allow attempts to factorise cubic such as $(x – 2x^2)(1 + 2x)$) etc			
	N.B. Should not be completing the square here.				
	A1: Accept either $x(1-2x)(1+2x)$ or $-x(2x-1)(2x+1)$ or $x(2x-1)(-2x-1)$. (No fractions f	for this final			
	answer)				
	Specific situations				
	Note: $x(1-4x^2)$ followed by $x(1-2x)^2$ scores B1M1A0 as factors follow quadratic factorisation	n criteria			
	And $x(1-4x^2)$ followed by $x(1-4x)(1+4x)$ B1M0A0.				
	Answers with no working: Correct answer gets all three marks B1M1A1				
	: $x(2x-1)(2x+1)$ gets B0M1A0 if no working as $x(4x^2-1)$ would e	earn B0			
	Poor bracketing: e.g. $(-1 + 4x^2) - x$ gets B0 unless subsequent work implies bracket round the	– <i>x</i> in which			
	case candidate may recover the mark by the following correct work.				
	N.B. If correct factors are followed by $x = 0, x = \frac{1}{2}, x = -\frac{1}{2}$ then ignore this as subsequent work.				
	But these answers- $x = 0$, $x = \frac{1}{2}$, $x = -\frac{1}{2}$ - with no working, or no factors, gets B0M0A0.				
	Ignore "=0" written at the end of lines and mark LHS as in the scheme above. Candidate who char	nges the			
	question to $4x^3 - x = x(4x^2 - 1) = x(2x - 1)(2x + 1)$ would earn B0 M1 A0 1/3

		1/11
	$= 2^{6x+9}$ or $= 2^{3(2x+3)}$ as final answer with no errors or $(y =)6x + 9$ or $3(2x + 3)$	A1
		[2]
		2 marks
	Notes	
	M1: Uses $8 = 2^3$, and multiplies powers $3(2x + 3)$. Does not add powers. (Just $8 = 2^3$ or $8^{\frac{1}{3}}$	= 2 is M0)
	A1: Either 2^{6x+9} or $= 2^{3(2x+3)}$ or $(y=)6x+9$ or $3(2x+3)$	
	Note: Examples: 2 ^{6x+3} scores M1A0	
	: $8^{2x+3} = (2^3)^{2x+3} = 2^{3+2x+3}$ gets M0A0	
	Special case: : $= 2^{6x} 2^9$ without seeing as single power M1A0	
	Alternative method using logs: $8^{2x+3} = 2^y \Longrightarrow (2x+3)\log 8 = y\log 2 \Longrightarrow y = \frac{(2x+3)\log 8}{\log 2}$	M1
	So $(y =)6x + 9$ or $3(2x + 3)$	A1 [2]

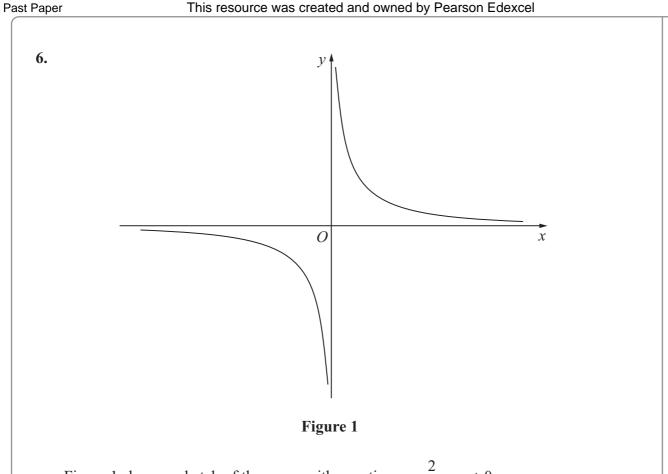

Figure 1 shows a sketch of the curve with equation $y = \frac{2}{x}$, $x \neq 0$

The curve *C* has equation $y = \frac{2}{x} - 5$, $x \neq 0$, and the line *l* has equation y = 4x + 2

(a) Sketch and clearly label the graphs of C and l on a single diagram.

On your diagram, show clearly the coordinates of the points where C and l cross the coordinate axes.

(a) **M1:** Curve implies *y* axis as asymptote and does not change shape significantly. Changed curve needs horizontal asymptote (roughly) Asymptote(s) need not be **shown** but shape of curve should be implying asymptote(s) parallel to *x* axis. Curve should not remain where it was in the given figure. Both sections move in the same direction. There should be no reflection

A1: Crosses positive *x* axis. Hyperbola has moved down. Both sections move by **almost** same amount. See sheet on page 19 for guidance.

B1: Check diagram and text of answer. Accept 2/5 or 0.4 shown on *x* -axis or x = 2/5, or (2/5, 0) stated clearly in text or on graph. This is **independent** of the graph. Accept (0, 2/5) if clearly on *x* axis. Ignore any intersection points with *y* axis. Do not credit work in table of values for this mark.

B1: Must be attempt at astraight line, with positive gradient & with positive *y* intercept (need not cross *x* axis)

B1: Accept x = -1/2, or -0.5 shown on x -axis or (-1/2, 0) or (-0.5, 0) in text or on graph and similarly accept 2 on y axis or y = 2 or (0, 2) in text or on graph. Need not cross curve and allow on separate axes.

(b) **B1:** For either correct asymptote equation. Second **B1**: For both correct (lose this if extras e.g. $x = \pm 1$ are given also). These asymptotes may follow correctly from equation after wrong graph in (a)

Just y = -5 is B1 B0 This may be awarded if given on the graph. However for other B mark it must be clear that x = 0 (or the y-axis) is an asymptote. NB $x \neq 0$, $y \neq -5$ is B1B0

(c) M1: Either of these equations is enough for the method mark (May appear labelled as part (b))

dM1: Attempt to solve a 3 term quadratic by factorising, formula, completion of square or implied by correct answers. (see note 1) This mark depends on previous mark.

A1: Need both correct *x* answers (Accept equivalents e.g. 0.25) or both correct *y* values (Method 2)

M1: At least one attempt to find *second variable* (usually *y*) using their *first variable* (usually *x*) related to line meeting curve. Should not be substituting *x* or *y* values from part (a) or (b). This mark is **independent** of previous marks. Candidate may substitute in equation of line or equation of curve.

A1: Need both correct *second variable* answers Need not be written as co-ordinates (allow as in the scheme) Note: Special case: Answer only with no working in part (c) can have 5 marks if completely correct, with **both** points found. If co-

ordinates of just one of the points is correct – with no working – this earns M0 M0 A0 M1 A0 (i.e. 1/5)

	M1: Expresses as three term polynomial with powers 3, -2 and –3. Allow slips in coefficients. This may be implied by later integration having all three powers 4, -1 and -2.		
	M1: An attempt to integrate at least one term so $x^n \rightarrow x^{n+1}$ (not a term in the numerator or denominator)		
	 A1ft: Any two integrations are correct – coefficients may be unsimplified (follow through errors in coefficients only here) so should have two of the powers 4, -1 and -2 after integration – depends on 2th method mark only. There should be a maximum of three terms here. A1: Correct three terms – coefficients may be unsimplified- do not need constant for this mark 		
	Depends on both Method marks		
	M1: Need constant for this mark. Uses $y = 7$ and $x = 1$ in their changed expression in order to f	find <i>c</i> , and	
	attempt to find <i>c</i> . This mark is available even after there is suggestion of differentiation. A1: Need all four correct terms to be simplified and need $c = 8$ here.
